EXPECTATIONS

WHY WEBPACK? - HISTORY OF WEB PERFORMANCE + JAVASCRIPT

GETTING STARTED - SETUP, INSTALLATION, SCRIPTS, AND CLI

THE CORE CONCEPTS

STARTING OUT RIGHT

THE ESSENTIALS

PUTTING IT TO PRACTICE

TRIAGE AND DEBUG

CHAPTER 1: WHY?

ORIGINS

JAVASCRIPT - IT'S JUST SCRIPTS!

```
const button = document.createElement(
'button');
button.innerText = "My button!";

document.body.appendChild(button);
```

2 WAYS TO LOAD

```
<!DOCTYPE html>
<html @lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta http-equiv="X-UA-Compatible" content="ie=edge">
    <title>Document</title>
</head>
<body>
    <script src="index.js"></script>
</body>
</html>
```

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta http-equiv="X-UA-Compatible" content="ie=edge">
    <title>Document</title>
</head>
<body>
    <script>
        var foo = "hello world!";
        console.log(foo);
    </script>
</body>
</html>
```

PROBLEMS

DOESN'T SCALE

TOO MANY SCRIPTS

Max Number of default simultaneous persistent connections per server/proxy:

339

```
Firefox 2: 2
Firefox 3+: 6
Opera 9.26: 4
Opera 12: 6
Safari 3: 4
Safari 5: 6
IE 7: 2
IE 8: 6
IE 10: 8
Chrome: 6
```

The limit is per-server/proxy, so your wildcard scheme will work.

FYI: this is specifically related to HTTP 1.1; other protocols have separate concerns and limitations (i.e., SPDY, TLS, HTTP 2).

TOO MANY SCRIPTS

UNMAINTAINABLE SCRIPTS

SCOPE SIZE READABILITY FRAGILITY MONOLITH FILES

SOLUTION?

IIFE'5

IMMEDIATELY INVOKED FUNCTION EXPRESSION

```
/**
 * Immediately Invoked Function Expression
 */
const whatever = (function(dataNowUsedInside) {
    return {
        someAttribute: "youwant"
      }
})(1)
/**
 * whatever.someAttribute
 *
      * 'youwant"
      */
```

REVEALING MODULE PATTERN

```
var outerScope = 1;
const whatever = (function(dataNowUsedInside) {
    var outerScope = 4;
    return {
        someAttribute: "youwant"
})(1)
console.log(outerScope);
```

TREAT EACH FILE AS IIFE (REVEALING MODULE)

CONCATENATE!

WE CAN "SAFELY" COMBINE FILES WITHOUT CONCERN OF SCOPE COLLISION!*

MAKE, GRUNT, GULP, BROCCOLI, BRUNCH, STEALJS

PROBLEMS

FULL REBUILDS EVERYTIME!

DEAD CODE

CONCAT DOESN'T HELP TIE USAGES ACROSS FILES

The cost of small modules

Posted August 15, 2016 by Nolan Lawson in performance, Web. 78 Comments

Update (30 Oct 2016): since I wrote this post, a bug was found in the benchmark which caused Rollup to appear slightly better than it would otherwise. However, the overall results are not substantially different (Rollup still beats Browserify and Webpack, although it's not quite as good as Closure anymore), so I've merely updated the charts and tables. Additionally, the benchmark now includes the RequireJS and RequireJS Almond bundlers, so those have been added as well. To see the original blog post without these edits, check out this archived version.

About a year ago I was refactoring a large JavaScript codebase into smaller modules, when I discovered a depressing fact about Browserify and Webpack:

"The more I modularize my code, the bigger it gets. 99"

- Nolan Lawson

Later on, Sam Saccone published some excellent research on Tumblr and Imgur's page load performance, in which he noted:

"Over 400ms is being spent simply walking the Browserify tree."

- Sam Saccone

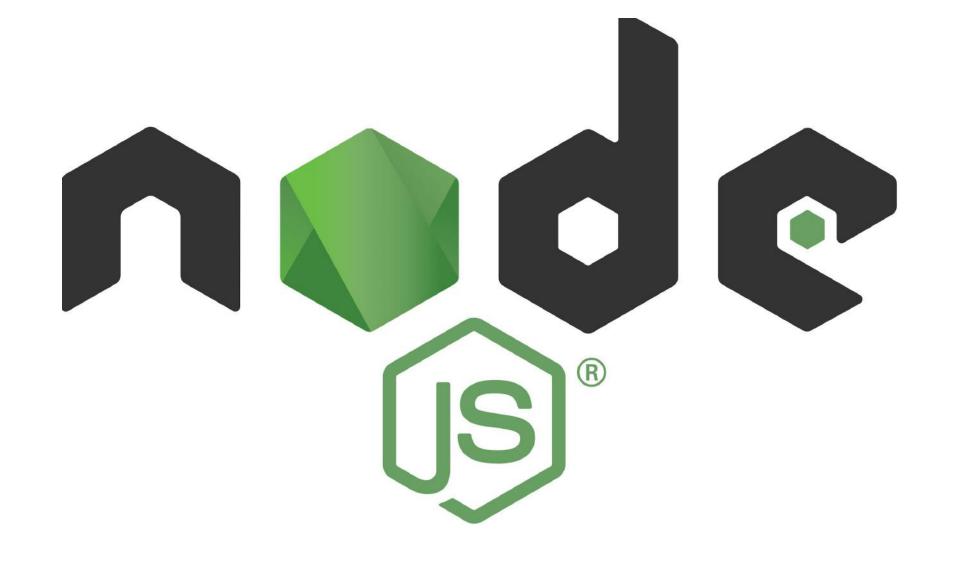

In this post, I'd like to demonstrate that small modules can have a surprisingly high performance cost depending on your choice of bundler and module system. Furthermore, I'll explain why this applies not only to the modules in your own codebase, but also to the modules within dependencies, which is a rarely-discussed aspect of the cost of third-party code.

LOTS OF TIFE'S ARE SLOW

DYWAMIC LOADING?

BIRTH OF JAVASCRIPT MODULES

COMMONJ5 (MODULES 1.0)

```
const path = require("path"); // used for builtin Node.js modules
const {add, subtract} = require("./math"); // or also used modules from another file
const difference = subtract(10, 4);
console.log(sum, difference);
const divideFn = require("./division");
exports.add = (first, second) => first + second;
exports.subtract = (first, second) => first - second;
```

STATIC ANALYSIS

NPM+NODE+MODULES

MASS DISTRIBUTION

PROBLEMS

NO BROWSER SUPPORT

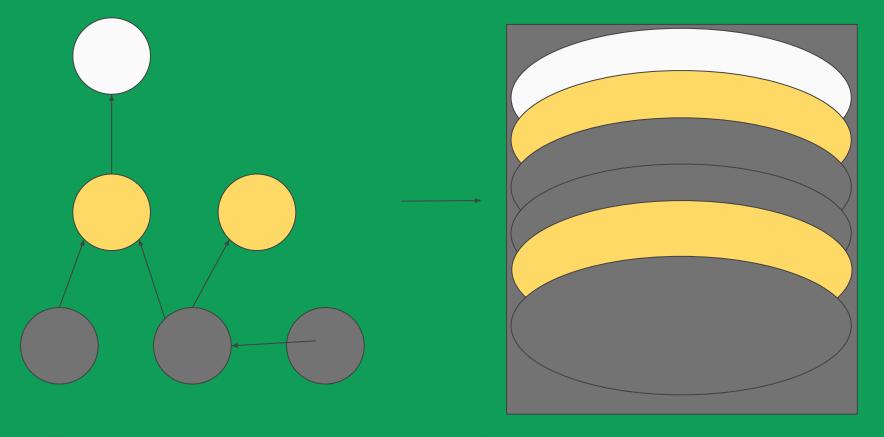

NO LIVE BINDINGS

PROBLEMS WITH CIRCULAR REFERENCES

SYNC MODULE RESO, LOADER (SLOW)

NO BROWSER SUPPORT

SOLUTION?

BUNDLERS / LINKERS

BROWSERIFY (STATIC) REQUIREJS (LOADER) SYSTEMJS (LOADER)

PROBLEMS

COMMONITS

```
//loading module
var _ = require('lodash');
//declaring module
module.exports = someValue;
```

NO STATIC ASYNC / LAZY LOADING (ALL BUNDLES UP FRONT)

COMMONJS BLOAT TOO DYNAMIC

NOT EVERYONE WAS SHIPPING COMMONJS.

```
define('myAwesomeLib', ['lodash',
'someDep'],
  function (_, someDep) {
    return { ... }
  }
);
```

AMD + COMMONJS

```
define( function(require, exports, module) {
    var _ = require('lodash');

    //..do things
    module.exports = someLib;
});
```

PROBLEMS

TOO DYNAMIC OF LAZY LOADING (MOMENTJS)

AWKWARD NON STANDARD SYNTAX (NO REAL MODULE SYSTEM)

SOLUTION?

ESM

```
import {uniq, forOf, bar} from 'lodash-es'
import * as utils from 'utils';
```

```
export const uniqConst = uniq([1,2,2,4]);
```

REUSABLE ENCAPSULATED ORGANIZED CONVENIENT

REUSABLE ENCAPSULATED ORGANIZED CONVENIENT

PROBLEMS

ESM FOR NODE?

HOW DO THEY WORK IN THE BROWSER?

ESM FOR BROWSER IS VERY VERY VERY SLOW

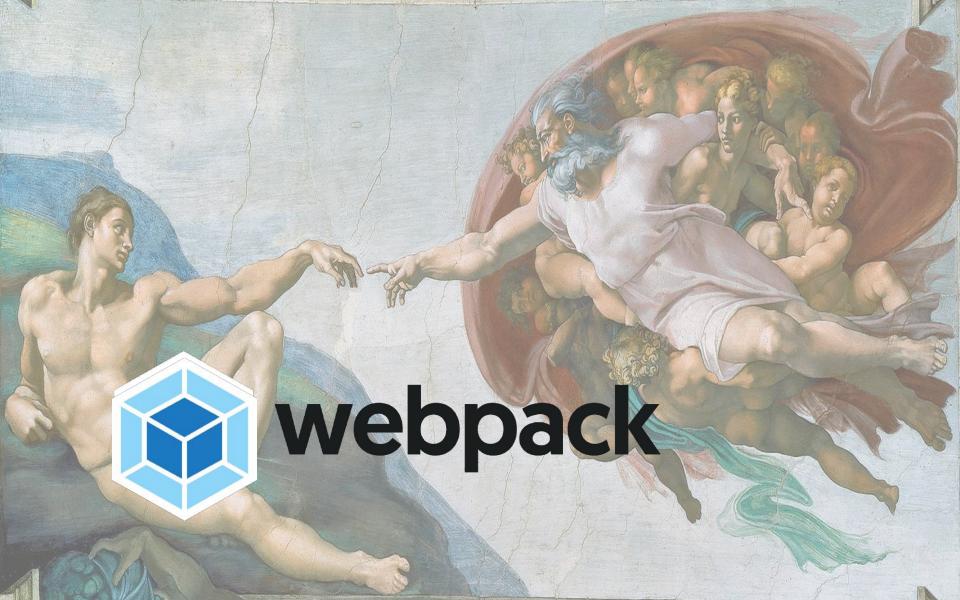

EVERY LIBRARY 15 DIFFERENT...

Library authors use the module types that they like and choose

AND THIS IS JUST FOR JAVASCRIPT...

Each and every other filetype until now has had to have specific ways to process it.

WOULDN'T IT BE NICE ...

WEBPACK IS A MODULE BUNDLER

LETS YOU WRITE ANY MODULE FORMAT (MIXED!), COMPILES THEM FOR THE BROWSER

SUPPORTS STATIC ASYNC BUNDLING

RICH, VAST, ECOSYSTEM

THE MOST PERFORMANT WAY TO SHIP JAVASCRIPT TODAY

WEBPACK - HOW TO USE IT?

CONFIG

(webpack.config.js) Yes, it's a module too!!!

```
module.exports = {
  entry: {
    vendor: './src/vendors.ts',
    main: './src/main.browser.ts'
  output: {
   path: 'dist/',
   filename: '[name].bundle.js'
```

WEBPACK - HOW TO USE IT?

WEBPACK CLI

\$> webpack <entry.js>
<result.js> --colors
 --progress

WEBPACK - HOW TO USE IT?

NODE API

```
var webpack = require("webpack");
// returns a Compiler instance
webpack({
   // configuration object here!
}, function(err, stats) {
  // compilerCallback
  console.error(err);
});
```

QUESTIONS?

BREAK!

CHAPTER Z - FROM SCRATCH

github.com/thelarkinn/webpack-workshop-2018

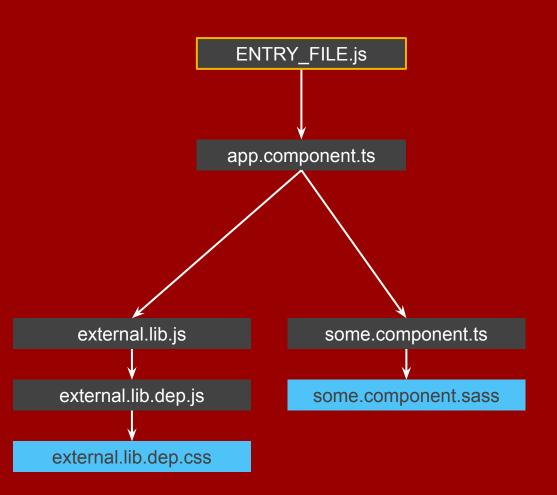

THE CORE CONCEPTS

ENTRY

THE CORE CONCEPTS: ENTRY

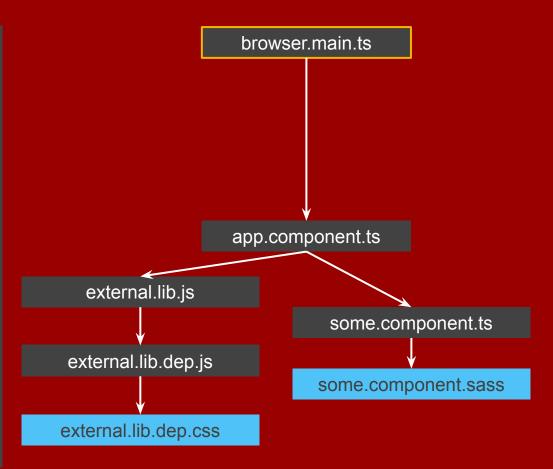

The first javascript file to load to "kick-off" your app.

webpack uses this as the starting point

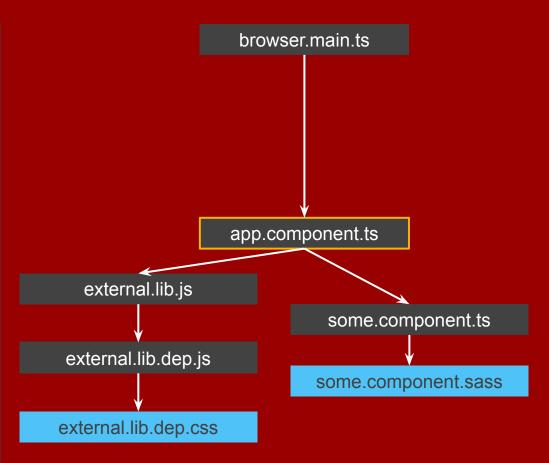

THE CORE CONCEPTS: ENTRY

```
module.exports = {
  entry: './browser.main.ts',
```

THE CORE CONCEPTS: ENTRY

```
import {Component} from
'@angular/core';
import {App} from
 ./app.component';
bootstrap(App,[]);
```

THE CORE CONCEPTS

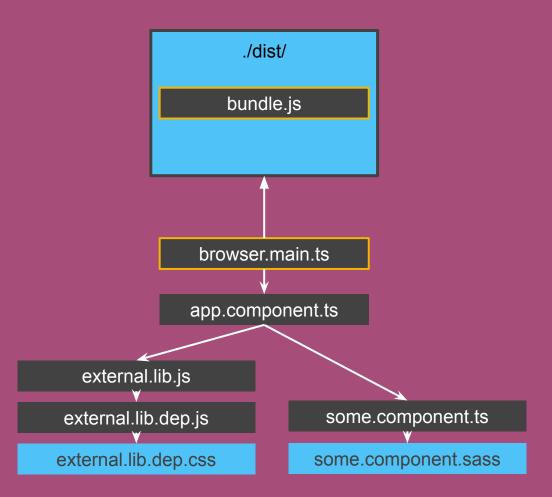

ENTRY

Tells webpack <u>WHAT</u> (files) to load for the browser; Compliments the *Output* property.

OUTPUT

THE CORE CONCEPTS: OUTPUT

```
//webpack.config.js
module.exports = {
  entry: './browser.main.ts',
  output: {
    path: './dist',
    filename: './bundle.js',
  },
  //...
}
//Generates bundle.js
```

THE CORE CONCEPTS

ENTRY

Tells Webpack WHERE and HOW to distribute bundles (compilations). Works with Entry.

LOADERS 4 RULES

Tells webpack how to modify files before its added to dependency graph

Loaders are also javascript modules (functions) that takes the source file, and returns it in a [modified] state.

```
entry.js
module: {
  rules: [
    {test: /\.ts$/, use: 'ts-loader'},
                                                      app.component.ts
     {test: /\.js$/, use: 'babel-loader'},
                                                       external.lib.js
     {test: /\.css$/, use: 'css-loader'}
                                                     external.es6.dep.js
                                                     external.lib.dep.css
```

```
test: regex,
use: (Array|String|Function)
include: RegExp[],
exclude: RegExp[],
issuer: (RegExp|String)[],
enforce: "pre" | "post"
```

test

A regular expression that instructs the compiler which files to run the loader against.

use

An array/string/function that returns loader objects.

enforce

Can be "pre" or "post", tells webpack to run this rule before or after all other rules

```
include: /some dir name/,
exclude: [/\.(spec|e2e)\.ts$/],
```

include

An array of regular expression that instruct the compiler which folders/files to include. Will only search paths provided with the include.

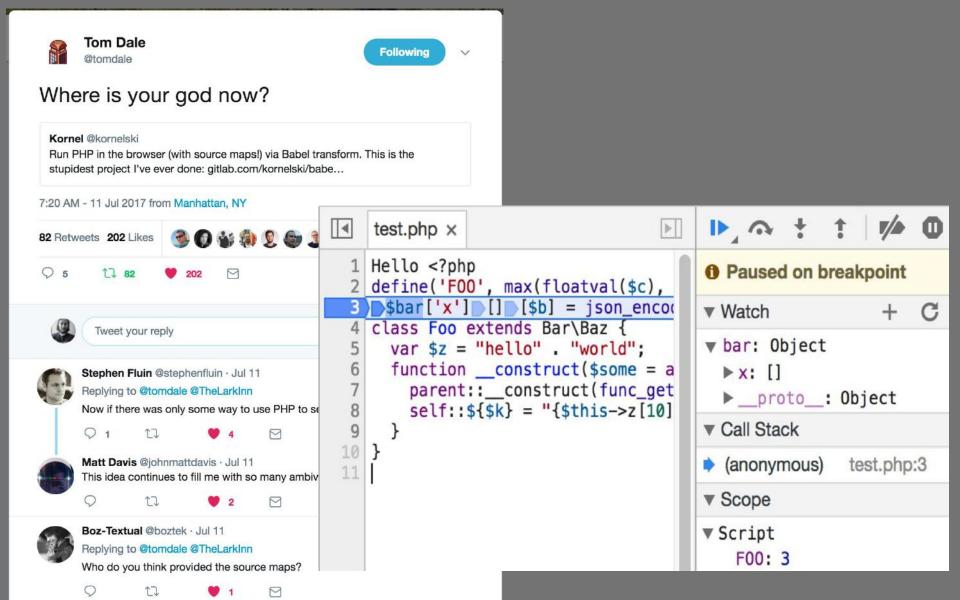

exclude

An array of regular expression that instructs the compiler which folders/files to ignore.

THE CORE CONCEPTS: LOADERS CHAINING LOADERS

```
rules: [
       test: /\.less$/,
       use:['style','css','less']
               less-loader
                                     css-loader
                                                          style-loader
       style.less
                           style.css
                                                                     inlineStyleInBrowser.js
```

THE CORE CONCEPTS

ENTRY OUTPUT LOADERS

Tells Webpack HOW to interpret and translate files. Transformed on a per-file basis before adding to the dependency graph

PLUGINS

Objects (with an `apply` property)

Allow you to hook into the entire compilation lifecycle

webpack has a variety of built in plugins

```
function BellOnBundlerErrorPlugin () { }
BellOnBundlerErrorPlugin.prototype.apply = function(compiler) {
  if (typeof(process) !== 'undefined') {
    compiler.plugin('done', function(stats) {
      if (stats.hasErrors()) {
        process.stderr.write('\x07');
    });
    compiler.plugin('failed', function(err) {
      process.stderr.write('\x07');
    });
module.exports = BellOnBundlerErrorPlugin;
```

Basic Plugin Example

A plugin is an ES5 'class' which implements an *apply* function.

The compiler uses it to emit events.

```
// require() from node_modules or webpack or local file
var BellOnBundlerErrorPlugin = require('bell-on-error');
var webpack = require('webpack');

module.exports = {
    //...
    plugins: [
        new BellOnBundlerErrorPlugin(),

        // Just a few of the built in plugins
        new webpack.optimize.CommonsChunkPlugin('vendors'),
        new webpack.optimize.UglifyJsPlugin()
    ]
    //...
}
```

How to use Plugins

require() plugin from node_modules into config.

add new instance of plugin to plugins key in config object.

provide additional info for arguments

CLICK HERE TO SEE THE LIST OF PLUGINS

TheLarkInn Merge 80% of webpack is made up of its own plugin system

```

THE CORE CONCEPTS

ENTRY OUTPUT LOADERS PLUGINS

Adds additional functionality to Compilations(optimized bundled modules). More powerful w/ more access to CompilerAPI. Does everything else you'd ever want to in webpack.

EXERCISE TIME

CHAPTER 3 - STARTING OUT RIGHT
